Nova's Stainless Steel Twin Wall
System

The NOVA® family of products has been specifically designed to meet the requirements for multi-functional applications serving a variety of fuels. Whether serving a traditional negative draught appliance or a modern high efficiency condensing appliance, the NOVA® product offers the ideal solution. With a wide range of components together with a multi-barb twist-lock jointing system, NOVA® offers the ultimate in ease of installation, quality and functionality. NOVA® is a CE approved product and has been tested to the requirements of BS EN 1856-1, see Table 1 - Chimney designation.

NOVA

Description

NOVA® is a prefabricated, factory made twin-wall insulated stainless steel system chimney. The fully welded construction combined with a high performance / high density insulating medium, provides the optimum level of performance required for today's modern high efficiency combustion equipment, as well as being suitable for the more traditional oil, gas and solid fuel fired appliance. The construction provides a high thermal resistance which ensures rapid stabilisation of the flue gas temperature and draught, whilst maintaining a relatively low temperature on the external surface of the chimney. NOVA® is designed for internal and external applications and is suitable for negative pressure applications. When used with a seal and where the flue gas temperature does not exceed 200°C, the NOVA® product is suitable for wet and positive pressure applications up to 200Pa (P1).

NOVA® utilises a multi-barb quick lock jointing system to secure each joint. The number of barbs depends on the product diameter, and in each case the components are secured by locating the barbs with a twist of each section. A locking band must then be used at each joint. The joint design facilitates a maximum unsupported height above the last support of up to 3.0 metres (2.0 metres for 100ID), subject to the design considerations detailed within the Installation Instructions and on page 30 of this brochure.

TWIST-LOCK JOINTING SYSTEM

NOVA® is manufactured from a high grade 316L (1.4404 : X2CrNiMo 17-12-2) stainless steel liner and a 304 (1.4301 : X5CrNiMo 18-10-2) outer case. The product utilises a high performance mineral wool which is auger filled into a 25mm annulus between the inner and outer, offering rapid stabilisation of draught and excellent thermal performance. The unique joint design allows the inner liner to freely expand and contract throughout the system as the flue gas temperature varies, alleviating the need for additional expansion component

Application

The NOVA® product is available in 8 internal diameters ranging from 100mm to 355mm and is suitable for oil, gas, and solid fuel applications operating under negative draught / dry conditions or where the maximum positive pressure will not exceed 40Pa as designated by N1, at a maximum flue gas temperature of 450°C.

Where used for solid fuel and oil applications where the flue gas temperature is greater than 250°C, the ventilated support components must be used as detailed on page 17.

For T600 temperature applications, NOVA® can only be applied where the chimney passes through non-combustible floors and where the chimney is enclosed throughout its length within a ventilated non-combustible enclosure or shaft. For more information, please contact SFL Technical Dept.

For condensing (WET) / positive pressure applications, where the flue gas temperature will not exceed 200°C at a maximum positive pressure of 200Pa (P1), an optional seal can be fitted to the NOVA® product as detailed on page 24.

For condensing applications it is important that any sloping runs are angled not less than 3° where head room is an issue or preferably 5° from the horizontal. Drainage components should also be incorporated into the system to allow condensate removal to a suitable drain or gully. Tees and elbows are provided within the NOVA® range to facilitate a 3° or 5° incline from the horizontal.

The ideal companion to Biomass heating appliances

Design & Quote in Seconds

Heralded as one of the most cost-effective, renewable and carbon-lean heat sources, wood, woodchip and wood pellet boilers are becoming increasingly popular throughout the UK & Europe.

NOVA® chimney system has been designed with the latest biomass plant in mind. From small household systems to full-scale public buildings, NOVA® is supported by a growing range of bespoke components for use with HETAS approved solid wood-based fuels.

To order NOVA® in satin black factory-finish, add a "B" to the end of the part number. e.g. for 150ID starter length, use part number 4570406NB

Lengths

Nova

Straight Length

Available in nominal installed lengths of 1500mm, 1000mm, 500mm, 250mm & 120mm.

Ø	Installed Length			
	120mm Code	250mm Code	500mm Code	1000mm Code
100mm	4575304N	4571904N	4575104N	4575004N
130mm	4575305N	4571905N	4575105N	4575005N
150mm	4575306N	4571906N	4575106N	4575006N
180mm	4575307N	4571907N	4575107N	4575007N

1500mm	
150mm	4579906N

Adjustable Length

The adjustable length offers a degree of flexibility when standard length dimensions are not suitable. All adjustable lengths are supplied with separate insulating material for insertion into the annulus once the installed length has been determined.

As the insulation density is installed on site and not controlled by SFL, we would recommend that this component is located at least 300mm from any combustible material.

Type Ø	Short (210mm - 320mm) Code	Long (310mm - 500mm) Code	Seal
100mm	4576604N	4574604N	4006310
130mm	4576605N	4574605N	4006313
150mm	4576606N	4574606N	4006315
180mm	4576607N	4574607N	4006318
200mm	4576608N	4574608N	4006320
250mm	4576610N	4574610N	4006325

	Short (255mm - 410mm)	Long (330mm - 550mm)	Seal

355mm	4576614N	4574614N	4006535

Where Adjustable Lengths are required for positive pressure and condensate resistance, two seals are required per component. See page 29 for installation details.

Starter Length

Designed to offer an aesthetic transition from the appliance outlet or connecting flue pipe to the NOVA chimney system.

Ø	A (mm) O.D	Code
130mm	125mm	4570405N
150mm	150mm	4570406N
180mm	175mm	4570407N
200mm	200mm	4570408N

Adjustable Slip Length

An alternative to conventional adjustable lengths, this component consists of a length which will fit inside an existing chimney length and a cover jacket to be insulated by the installer with the insulation provided.

A distance of 300mm to combustible materials should be observed when installing this component.

N.B. This component does not form a complete length of twin-wall chimney (as do our regular adjustable lengths) and requires a standard straight length of the same diameter. See adjustment range data on P.28.

Draught Regulator

Dual action draught regulator suitable for gas, oil and solid fuel applications. Designed to be used with SFL chimney systems where excessive draught is likely to create combustion problems. When used with the NOVA chimney system, the regulator should be applied with the 45785XXN appliance adaptor (in turn located onto the 90° tee branch)

Draught Regulator c/w Pressure Relief

Ideal for use on biomass pellet appliances but also suitable for gas and oil fired appliances where the flue gas temperature will not exceed 400°C. The component also includes an explosion/pressure relief mechanism as required by many biomass appliance manufacturers. Supplied c/w Male Adaptor.

Note: This component is supplied with an un-barbed male coupler to allow the Draught Regulator to be positioned plumb vertical at any angle of flue-run.

Although we manufacture an extensive range of components, SFL understands that there are times when a standard component will simply not work for the intended installation. Being a UK manufacturer, we are ideally placed to manufacture bespoke components in a timely and competitive manner. Please photocopy and complete the required dimensions for the required special component and fax / scan and email your requirements to SFL Customer Services Dept, who will be happy to offer a quotation and lead time.

Single Wall to NOVA® Anchor Plate

Designed to be used when connecting NOVA® to a lintel or pre-cast chamber. A short section of liner projects a nominal 32mm through the bottom of the plate. Installed length "H" is 40mm while "E" is 27mm and there are 8 x 11mm fixing holes at the centres shown in the table below. Manufactured in stainless steel. Maximum Load: 13m

Wall Bands

Wall bands provide lateral support for the chimney and must be used at intervals not exceeding 4.0 metres beyond any load bearing support.

For external applications the stainless steel version must be used.

See page 26 for application information

Wall Band Extension Pieces

Used with Wall Bands, these components allow the clearance between the wall and outer surface of the chimney to be increased. Where externally applied, the intervals between Wall Band fixing centres must be reduced from 4.0 metres to 3.5 metres. The maximum clearance is as detailed below.

See page 26 for assembly details

Ø	Dim A	Stainless Code	Galvanised Code	Extension (mm)		Stainless Code	Galvanised Code

Support Components

Nova

Pick & Mix Support System

An alternative system to SFL's conventional support components, designed to offer a flexible solution to the individual support requirements of domestic installations. Available for chimney diameters up to 250mm, each part is ordered separately to comprise the bracket required.

The Wall Band is designed to offer 50mm clearance from the outer case of the chimney to the back plate of the bracket. Where required, Extension Brackets can be used to increase this distance to within the specified dimensions as detailed within the table below. The bracket must be installed plumb and fixed to the structure using adequate fixings. The Wall Bracket is fitted with two M6 Nut Inserts to allow easy fixing of the two Support Band Rings using the M6 bolts and washers provided.

Extension Brackets are designed to extend the clearance from the outer case of the chimney to the structure. The Extension Brackets have been designed to slide through on the inside of the Wall band and can be cut to length if required.

Maximum/minimum distances for wall bands and extension arms:

Ø	Max SHORT	Max MEDIUM	Max LONG	Min with Arms	Min without Extension Arms
100mm	249	320	525	55mm	50mm
130mm	234	305	510	55mm	50mm
150mm	224	295	500	55mm	50mm
180mm	209	280	485	55mm	50mm
200mm	199	270	475	55mm	50mm
250mm	174	245	450	55mm	50mm

Bracing Brackets can be attached to the Extension Brackets along with the Support Plate and Universal Split Band to produce a Wall Support for vertical loading.

Ø	Maximum extension			Loading
	SHORT	MEDIUM	LONG	Max Loading (m)
100mm	124	195	400	8.6
130mm	94	165	370	7.0

Floor & Ceiling Penetration

Nova

Gas and oil appliance (T250)

The following components MUST be used on gas or oil fired appliances where the flue gas temperatures does not exceed 250°C and / or where the chimney passes through a non-combustible floor.

Ceiling Support

Provides a 50mm air gap clearance to a penetrated floor or ceiling and is only used where NOVA® penetrates a non-combustible floor, and / or services a gas or oil fired appliance where the flue gas temperature does not exceed 250°C

Firestop Spacer

Used to provide location, fire and dust stopping where NOVA® is used through non-combustible floors, and / or serves a gas or oil fired appliance where the flue gas temperatures does not exceed 250°C. This item does not load bear.

Ø	Dimension (mm)		Code	Dimension (mm)		Code

Solid fuel and oil fire appliance (T450)

The following components MUST be used where NOVA® is used on solid fuel or oil fired appliances where the flue gas temperature will not exceed 450°C and / or where the chimney system penetrates a combustible floor. Each ventilated component offers a 50mm clearance to combustible materials.

Standard Ventilated Ceiling Support

Ventilated Firestop

D5 Ventilated Ceiling Support

D5 Ventilated Ceiling Support Underneath View

Standard Ventilated Ceiling Support (T450)

Used to both support and firestop the chimney system when it passes through the first combustible floor directly above the appliance. The support component incorporates a patented intumescent matrix design which expands rapidly with temperature and seals the plate to prevent the potential spread of fire or smoke from the room below.

Ø	Dim (mm)			Code	Dim (mm)			Code

Patented Design

For basic installation information concerning floor penetrations, please see page 26 of this brochure

Domestic Gas Installation Termination Heights

Figs 5.1-5.3 (opposite) illustrate terminal siting for common installation situations for further requirements, refer to BS5440-1

No part of the flue outlet shall be less than 1.5 metres measured horizontally to the roof surface, or any wall. Where the flue terminates above the ridge, it shall do so by not less than 600mm, other than where the flue terminates with a purpose designed ridge terminal.

The chimney should not penetrate the dark shaded area.

Solid Fuel Chimney Termination Heights.

Chimney termination heights and positions are subject to current Building Regulations and National Standards. The illustrations are based Approved Document J of the Building Regulations for solid fuel and oil fired appliances. Domestic natural gas fired appliances are governed by BS5440-1. All other European countries are governed by their own Regulations, however reference can be made to the countries National Annex of BS EN 15287-1 for individual requirements.

If the chimney serves an oil fired appliance with a pressure jet burner, the chimney must discharge a minimum 600mm above the roof penetration point, or any adjacent structure, if it is within 750mm. It must also be at least 600mm from any opening into the building and 300mm from any combustible material.

Where used with an oil fired appliance with a vaporising burner, termination must comply with the details in this diagram

Minimum distance measured from the top of the chimney construction, excluding any pot or terminal:

- A 2.3 metres horizontally clear of the roof surface, e.g. if the roof pitch is 45°, then the chimney should project 2.3 metres above it.
- B 1.0 metre, provided A is satisfied, or 600mm above the ridge if G is less than 600mm.
- C 1.0 metre above the top of any flat roof, and the top of any openable roof light, dormer window or ventilator, etc., if it is located within 2.3 metres.
- D/E If D is less than 2.3 metres, E shall be not less than 600mm.
- F 600mm above the ridge.
- G If G is within 600mm of the ridge then B shall be 600mm above the ridge.

Gas Terminal

The Gas Terminal is available from 100mm to 355mm internal diameter.

ø	A	B	Code

Flue Outlets for Oil-Fired Appliances

Flue termination heights for oil-fired appliances must comply with BS EN 15287-1. The table below explains minimum distances in most common situations with reference to FIG. 5. For further information, please refer to the relevant National annex.

		Pressure Jet	Vapourising
B	Above the highest point at which the chimney crosses the roof	600mm	1000mm
D	From an adjacent structure	750mm	2300mm
E	Above the height of an adjacent structure at the following distances from the edge of the flue: Pressure Jet: 750mm; Vapourising: 2300mm	600mm	1000mm

Fig. 5: Termination heights, not including cowl or terminal

Terminals

Nova

Top Stub

The terminal offers the least resistance to flue gases and is ideal for solid fuel and oil fired appliances, providing there is drainage at the base of the chimney.

Top Stub With Mesh

Ideally suited for condensing/high efficiency appliances. Not suitable for solid fuel application or where there is no provision for drainage below termination.

Flashings & Weathering

Nova

In addition to the conventional range of aluminium flashings for slate roofs, SFL now offers an environmentally friendly alternative to lead flashings for use on uneven roofing materials. SFL Eco Pro Lead-free, malleable flashings feature a durable 0.6mm 304 BA stainless-steel cone, formed and adhered to the flashing base.

The flashing base can be dressed in exactly the same way as lead and is highly flexible. Craftsmen experienced in working with lead covering will find it easy to apply.

The lead-free base is highly weather resistant, completely waterproof and provides a breathable membrane which prevents the build-up of condensation. It is one third the weight of conventional lead and does not require the application of patination oil to prevent oxidation. As well as all the physical and environmental benefits, there is peace of mind that your flashing will not be the target of lead thieves and the inconvenience caused by lead theft.

N.B. Where the lead-free base is in contact with rainwater contaminated by copper or bitumen, a protective coating will need to be applied. Please contact SFL Customer Services for details.

SFL EcoPro Lead-Free Flashings

5° – 30° Adjustable Flashing

For low pitched roofs.

32° – 45° Adjustable Flashing

For high pitched roofs.

SFL EcoPro EPDM Synthetic Rubber Flashing

The selection of the correct flashing depends on the outside chimney diameter and intended roof pitch. The table identifies which flashing should be used. Each consists of a malleable aluminium base to which an EPDM rubber cone is sealed. The cone is easily trimmed on site to suit the external diameter of the chimney. Separate installation instructions are provided with every flashing.

Ø	Ext Dia (mm)	Roof Pitch	Flashing No.	Cone Index Cut Line	Base Size (A)	Code
100mm	150	0-35°	1	E	500X500mm	4901015
130mm	180	0-40°	2	E	600x600mm	4901020
150mm	200	0-30°	2	F	600x600mm	4901020
150mm	200	0-45°	3	C	764x764mm	4901030
180mm	230	0-40°	3	D	764x764mm	4901030
200mm	250	0-35°	3	F	764x764mm	4901030
250mm	300	0-30°	3	I	764x764mm	4901030
250mm	300	0-45°	4	A	956x956mm	4901045

The EPDM flashing system will effectively seal and remain pliant over a wide range of external chimney surface temperature extremes from -30° to 115°C. The EPDM cones have also been proven to withstand intermittent surface temperatures of up to 150°C.

EPDM flashings should not be used on single wall chimney systems serving solid fuel appliances or any application where the potential surface temperature of the chimney will exceed the maximum design temperatures details above.

Flashings & Weathering

Nova

Aluminium Storm Collar

Used to weather the top of the flashing, supplied with a tube of silicon sealant.

∅	A	B	C	Code
100mm	152	255	70	70123406

355mm	4578614

Joint Sealing Ring (W/P1)

This optional component is available for all diameters and is located in the joint groove as detailed in the Installation Instructions and on page 24. This component provides a moisture and gas resistant seal to a pressure of 200Pa as tested to P1 under BS EN 1856-1. The seal would normally be used on applications where there is a likelihood that condensation of the flue gases could result or where the chimney is operating under positive pressure conditions where the flue gas temperature will not exceed 200°C (T200).

Important: SFL seal lubricating compound should be applied around the surface of the seal and interfacing surface prior to making the joint. It is also recommended that the seal is carefully bonded to the fixing groove prior to installation with a suitable silicon adhesive/sealant.

Ø	Code

304mm	4578612MT
355mm	4578614MT

Joint Sealing Ring (W/P1) for 305mm and 355mm Adjustable Lengths ONLY

These seals are to only be used for the internal slip section of the 305mm and 355mm Adjustable Lengths. All other sizes utilise the standard Joint Sealing Ring as detailed above, Part No. 40063XX in the slip section. See page 29.

Ø	Code
304mm	4006530
355mm	4006535

Seal Lubricant

This must be applied around the circumference of the fitted seal to provide a lubricated interface between the seal and the liner when the product is used for positive pressure and wet applications.

	Code
250ml	3107500

Only SFL lubricant should be used as it has been specially formulated for use with both silicone and EPDM seal materials. Failure to use SFL lubricant when installing seals in NOVA product will invalidate the product warranty and potentially cause failure of the seal.

Lateral Supports

Wall Bands are available for the lateral support of the installation. These are available in both galvanised steel and stainless steel for external applications. All Wall Bands offer 50mm clearance from the outer case of the flue. Optional Extension Brackets are available to increase this distance up to a maximum of 100mm, see page 15.

Roof / Rafter Support

A roof / rafter support bracket is available where the flue section passes through the roof to termination. This component offers both lateral and vertical loading. For more information, see page 14.

Joint design and construction

A – Coupler separator

The coupler separator is a 1mm dimple which is designed to allow a controlled amount of air to pass across the coupler interface. This limits thermal bridging and heat transfer across the joint as well as reducing the potential for capillary moisture movement.

B – Retrofit seal

The NOVA® product offers a retrofit seal that can be fitted around the inner groove as shown above. The seal facilitates positive pressure and condensate resistance up to 200Pa at a maximum flue gas temperature of 200°C, offering a P1 rating to BS EN 1856-1. For higher pressure capability, please refer to SFL Technical Department.

C – Quick lock jointing system

The NOVA® joint incorporates a sixteen barb* twist lock coupler system to allow easy and rapid installation of the product. When used with the NOVA® support components the joint will support up to 3.0* metres free standing above the last support. See Installation Instructions or page 19 for further details.

* 100mm internal diameter has 8 barbs and a free standing capability of 2.0 metres, subject to design guidance.

D – Locking Band

The locking band is used to complete the joint and incorporates a simple fixing mechanism to facilitate speed and ease of installation.

Joint Assembly

The joint is made by fitting the female end over the male end and engaging the joint system by rotating the component clockwise. A locking band is then fitted to finalise the joint, as detailed below.

Fig. 1

Approvals

The NOVA® product has been assessed and CE marked to BS EN 1856-1 to the performance designations as detailed on page 4, Table 1.

NOVA® has also been assessed by the Loss Prevention Council for fire resistance. A fire resistance of two hours can be achieved in accordance with the stability and integrity criteria of BS 476: Part 20 for duct type B.

Quality

All components are manufactured under a quality assurance scheme, certificate No. FM557622, administered by British Standards in accordance with BS EN 9001. In addition SFL operate a CE approved factory production control system as required under the Construction Products Regulation.

Installation Regulations

Where the flue passes through combustible floors it is important that the correct firestop components are used and the correct distance to combustible materials is observed.

All firestop and support components within the NOVA® range are designed to offer a minimum clearance to combustible material of 50mm. In all instances the requirements of the building regulations must be complied with and the appropriate references are: Document J of the DOE Building Regulations, Section F of the Building Standards (Scotland), Section L of the Building Regulations (Northern Ireland). Reference should also be made to the relevant British and European Standards governing the installation of flue and chimney products for the associated fuel and appliance types as detailed:

- Solid Fuel and Oil Fired Applications: BS EN 15287
- Domestic Gas Installations up to 60kW: BS5440: Part 1
- Commercial Gas Installation up to 70kW and 1.8MW (net), the installation should conform to BS 6644

For further information, please refer to Installation Instructions in this document.

System Details

Nova

Note: In the UK, connection to an appliance which is not connected to a fuel supply, may be carried out by a competent person. However connection to an appliance that is connected to a fuel supply must be carried out by an approved and registered heating engineer, e.g. Gas Safe(Gas) or OFTEC (Oil). For other European countries, reference should be made to EN 15287: Part 1: Chimneys- Design, installation & commissioning of chimneys. Chimneys for non-room-sealed heating appliances. The National Annex NA of EN 15287 should detail the national regulatory requirements for that particular country.

Components

The NOVA® product offers a complete range of prefabricated components allowing total flexibility to meet today's demanding applications. Installed lengths of 1500mm, 1000mm, 500mm, 250mm and 120mm are available, together with adjustable lengths. A variety of tees, elbows, supports, fixings and firestop components are available as standard throughout the diameter range.

Those components within the range that are manufactured from only single skin, can be vulnerable when exposed to the products of combustion from solid fuel appliances. This is especially true for terminals; however in the majority of cases, an open-ended terminal better suits appliance performance, but it is acknowledged that on occasions, other types of terminal from the range have to be used to reduce rain entry. The condensate collector and locking plug when used on solid fuel are also vulnerable to flue gas by-products, particularly if the chimney is not regularly maintained and cleaned. Such components are considered sacrificial and their life expectancy will vary depending on application, location, maintenance and fuel usage. For this reason, these items are only covered by a twelve month guarantee and not the standard 15 year conditional manufacturing defects warranty.

Life Expectancy and Affecting Factors

The NOVA® product is manufactured to the highest standard and tested in accordance with EN 1856-1. Under normal operating conditions NOVA® should provide many years service and is provided with a 15 year conditional manufacturing defect warranty. However careful consideration of the following points must be observed to limit the risk of chemical corrosion to the product.

Chemical contamination of combustion air

Under no circumstances should an appliance be located where there is the potential of chemical contamination of the combustion air. Typical examples are de-greasing plants, dry cleaning agents and chemical cleaning products.

Chemical chimney cleaning products

Under no circumstances should chemical chimney cleaning products be used. Only traditional sweeping of the chimney should be employed.

Use only approved solid fuels

Where used on solid fuel, care should be taken to ensure that only high quality fuel is used. SFL do not recommend fuels such as petroleum coke or other fuels containing a blend of petroleum coke. Also some smokeless fuels contain halogens that are released when burnt, forming Hydrochloric and Hydrofluoric Acids. These fuels can lead to premature failure of the chimney system through corrosion. Before burning any fuel, SFL would suggest that written confirmation is obtained to ensure that the fuel is halogen free. Only HETAS Approved solid fuels should be used with SFL products.

It is also important when burning wood that it has not been treated and is free of any potential chemicals such as preservatives, insecticides or pressure treatments. Freshly cut firewood can contain up to 50% moisture, provision must be made to allow the wood to season so that the moisture content is reduced to around 20%. This must be done in a dry environment and can take up to 8 months. Green wood can lead to products like creosote being deposited on the chimney liner and could lead to a chimney fire occurring or premature corrosion / failure of the liner.

Biofuels

NOVA® is suitable for virgin pellet and wood chip biofuel applications where the fuel complies with BS EN 14961 Parts 1-6. Other forms of biofuel when burnt can produce aggressive and corrosive acids, especially at low temperatures, which can lead to premature failure of the product. Written confirmation should be obtained from SFL prior to installing NOVA® for use on any other type of biofuel.

Coastal locations

It is advised where the chimney is exposed to severe coastal locations that suitable external protection is applied to the outer case of the product. This could be achieved using a specialist protective coating or by having the product professionally painted. It is recommended that only stainless steel components are used for external applications; however where galvanised components are used, they should be adequately protected using an appropriate coating.

Typical installation serving condensing appliances

Calculation and Technical Support

Using the latest software modelling, SFL can undertake full chimney sizing calculations to BS EN 13384 Parts 1 & 2 as well as advise on other technical matters regarding the Clean Air Act and current regulations regarding chimney systems.

Installation

Nova

The illustration below shows a typical support arrangement for an external chimney. The vertical weight of the chimney is taken by a wall support bracket. A removable condensate collector (45769**) is fitted to the underside of the wall support bracket which can also be removed for sweeping. Wall bands (3115***) are then installed every 4.0 metres to provide lateral support. It is essential that adequate bracing is provided directly before and after an offset or change in direction. It is important that adequate fixings are used throughout the chimney system to anchor support components to the structure, such as M10 rawl bolts etc.

Wall Band Assembly

Combustible floor penetration (>250°C)

Where the chimney system is used with appliances producing flue gas temperatures exceeding 250°C, and where the chimney passes through a combustible floor, the following ventilated components **MUST** be used. All floor penetration components are designed to be secured to a pre-built frame construction and lined with a 30 minute fire resistant board to the dimension detailed in Table 3.

Basic installation diagram of ventilated ceiling support and ventilated firestop components

Installation

Nova

Ventilated Ceiling Support and Ventilated Firestop

Note: The fire rated board is required under the test conditions of BS 476: Part 20 where the chimney passes through a representative combustible floor. The purpose is to protect the ceiling void from the effects of radiated heat from the outer case of the chimney where the chimney below the ceiling is engulfed in fire.

Framing data and dimensions

Chimney Size	100	130	150	180	200	250	300
'A' Square*	251	281	301	331	351	401	451

* The above dimension does not allow for 30 minute fire rated lining, adjust according to thickness used.

Elbow offset dimensions

This data relates to just two elbows used to form an offset as shown in Fig. 2. It also indicates the installed length of the elbow segments. Data is also provided where standard lengths are also incorporated within the offset, see Fig. 3.

Wall Support Bracket – technical information

Support configuration and distance between brackets

ø (mm)	A (m)	B (m)	E (mm)
100	30	25	150
130	30	25	150
150	30	25	150
180	20	15	200
200	20	15	200
250	20	15	220
304	20	15	267
355	18	12	293

This table details the maximum distance in metres between wall supports, based on the support configuration below.

IMPORTANT: Wall support loadings are dependent on appropriate wall fixings and the structural integrity of the wall itself.

Product weights

Maximum weight of NOVA® per metre run installed, excluding support components.

ø (mm)	100	130	150	180	200	250	304	355
kg/m	6.6	8.1	9.2	10.8	11.8	14.5	17.1	19.7

Maximum structural considerations for components

The table below shows the maximum number of metres that can be applied to various components. It is essential that these are not exceeded. Where possible components such as inlet tees and inspection lengths should not be vertically loaded, but suspended below a support component, such as the wall support assembly. Where this is unavoidable, refer to the maximum heights in the table below.

Table 2

Components	Diameter (mm)							
	100	130	150	180	200	250	304	355
Inspection length	13m	13m	13m	13m	13m	13m	13m	12m
Ceiling support	6m	6m	6m	6m	6m	6m	6m	6m
Ventilated ceiling support	6m	6m	6m	6m	6m	6m	6m	6m
Anchor plate	13m	13m	13m	13m	13m	13m	13m	13m
Universal support plate	13m	13m	13m	13m	13m	13m	13m	13m
95° & 90° tee	13m	13m	13m	13m	13m	13m	13m	13m

Adjustable Slip-Length with Cover Jacket

Component extension limits above an existing length

Dia ø	Combined adjustment range on standard lengths							
	Extension		250mm		500mm		1000mm	
	Min	Max	Min	Max	Min	Max	Min	Max
80	48	295	375	545	550	795	1050	1295
100	48	295	375	545	550	795	1050	1295
130	48	295	375	545	550	795	1050	1295
150	48	295	375	545	550	795	1050	1295
180	48	280	375	530	550	780	1050	1280
200	48	270	375	520	550	770	1050	1270
250	48	245	375	495	550	745	1050	1245

N.B. The Adjustable Slip Length requires a standard length to make a complete component. Adjustable lengths are not loadbearing. A support component should be used immediately above.

Installation

Nova

Detailed installation instructions are provided with all adaptors and terminals, and are also available separately on request, detailed below are key installation requirements for the NOVA® chimney system together with regulatory requirements for the UK. For countries outside of the UK, please refer to your country's own regulations and national standards.

General

The installation of the NOVA® product must be in accordance with local building regulations and associated National Standards and Codes of Practice.

For additional guidance, reference can be made to BS EN 15287-1: Chimneys- Design, installation & commissioning of chimneys. Chimneys for non-room-sealed heating appliances The National Annex NA of EN 15287-1 will detail the national requirements for the particular country.

Every chimney section and fitting shall be used as manufactured for assembly on site without any alteration or cutting. Components are joined with a multi barbed twist lock coupler and secured with a locking band. The only exception are elbows, which are designed to allow full rotation of the component and therefore do not have locking barbs on the female end. All components must be installed with the male coupler facing up as detailed in Fig.1 on Page 24.

NOVA® is suitable for both internal and external applications. Where used on high efficiency condensing appliances, a range of components are available to permit deliberate drainage of condensate, either back to the condensate removal component within the chimney system, or through the heating appliance. No part of the chimney system should be constructed to form an angle greater than 45° from the vertical.

Although components are included that will permit horizontal application, they should only be used for connection to the appliance. Where the system is being used for a condensing application, sections MUST run at an angle not less than 3° - 5° from the horizontal, using tees, elbows and fittings designed for that purpose. Failure to provide adequate drainage could lead to premature failure of the product and seal.

Offsets can be constructed using elbows, lengths and adjustable components available within the system. For full details regarding offset dimensions and heights for various elbow/length combinations see tables on Page 27. According to building regulations: If bends are necessary there must be no more than four in the length of the chimney. The angle of the bend should be no greater than 45° from the vertical, with the exception that 90° factory made bends or tees may be treated as being equal to two 45° bends.

Where an offset is used, the length of chimney between the two elbows MUST NOT exceed 20% of the total vertical length of the chimney.

Where serving solid fuel or oil appliances, any part of the chimney which passes through any room other than that in which the appliance using the chimney is situated, should be protected to prevent damage and accidental location of combustible material against the outer skin. It is a building regulation requirement that ANY factory made insulated chimney should be enclosed where passing through a cupboard, storage space or accessible roof space.

Where used with solid fuel or oil appliances producing flue gas temperatures exceeding 250°C, the clearance at floor / ceiling joists must be established using the ventilated ceiling support and ventilated firestop components. When connecting to a single wall connecting flue or vitreous pipe, at least 425mm of NOVA® must project below the appliance room ceiling before connection is made.

Under no circumstances must there be a joint within the thickness of any floor space. Where passing through a cavity wall a wall sleeve must be used and finished with a suitable trim plate / cover ring.

The internal diameter of the chimney must conform to the requirements of the appliance manufacturers instructions and should not, under any circumstances, be less than the diameter of the appliance outlet unless operational requirements of the appliance can be demonstrated by calculations to BS EN 13384-1

The height of the chimney will depend on the building structure, however a height of 4.5 metres from the top of the appliance outlet to termination is considered the minimum for solid fuel. To prevent excessive cooling of the flue gases when connecting a single wall flue pipe from the stove to the NOVA® chimney, SFL recommends that the length of the single wall pipe is no more than 2.0 metres within the 4.5 metre height recommendation under Building Regulations.

Adjustable Lengths

Each Adjustable Length is supplied in two halves together with an insulation pack. When required for positive pressure or wet systems, two seals are required in addition to the Adjustable Length. Fit and lubricate seals as show in the diagram below. Depending on the required finished length of the component, additional insulation is added to the annulus of the top section. The top section is then slid over the bottom section and the component installed. Self-tapping screws are then used to secure the overlapping sections.

The Adjustable Length does NOT load bear. Always use a Wall Support Assembly or Support Plate immediately above this component when vertically applied. Adjustable Lengths should maintain a clearance of at least 300mm to combustible materials.

Please note that the design of the 300ID and 350ID Adjustable Length is different to the 100ID to 250ID as detailed in the diagrams below.

100ID - 250ID Adjustable Length seal position (Suitable for gas and kerosene oil)

Where condensate and pressure resistance is required, the 100ID to 250ID Adjustable Length requires two standard seals fitted in both the top and bottom sections of the component as detailed opposite. Ensure that the seal is well lubricated and the interfacing materials are clean and free of dirt prior to assembly.

304ID - 355ID Adjustable Length seal position (Suitable for gas only)

Where condensate and pressure resistance is required two different seals need to be fitted to the upper section. Unlike the 100ID - 250ID, no seal is required in the bottom section. The top seal is located in the groove inside the throat of the male coupler. The bottom seal is stretched over the circumference of the liner and located in the groove. Ensure that the seal is well lubricated and the interfacing materials are clean and free of dirt prior to assembly.

Installation criteria for maximum freestanding height

About Us

Since 1969 we have provided expertise in system design and innovation for commercial, domestic and industrial applications, with uncompromised customer service. Our portfolio of trusted brands are known throughout the world for their engineering excellence.

We are proud of our British built heritage at SFL. All our products are fabricated at our manufacturing centre in Barnstaple, Devon, UK. As well as investment in the latest manufacturing system, we also have an extensive R&D centre ensuring continuous product development and testing to the latest European Standards.

Our Brands

SFL branded products are synonymous with the highest quality – it is this reputation that enables specifiers, contractors and house-holders to use our products with total confidence.

Produktankündigung – Inspektionslängen
Reference 20221019 V2

Nach einer kürzlichen Überprüfung des Designs und der Materialverfügbarkeit unserer Inspektionslängen werden wir ab sofort die N1/D Inspektionslänge aus unseren Produktfamilien Nova und Europa zurückziehen.

Wir werden weiterhin die P1/W Inspektionslänge liefern, und unser Engineering-Team hat empfohlen, dass die Dichtungen für N1/D-Anwendungen bei hohen Temperaturen entfernt werden können.

Unsere Literatur wird aktualisiert, und die Preislisten wurden entsprechend geändert.

Inspection Length N1/D – 45762XXN / 17468XX

Inspection Length P1/W – 45763XXN / 17463XX

Vielen Dank für Ihre fortgesetzte Unterstützung und Ihr Geschäft.

Yours Sincerely,

James Whale
